

Motivation Letter
Master's Degree in Economics
April 2026

My interest in Economics developed gradually through both academic study and practical experience. During my undergraduate degree in Accounting, I gained a structured understanding of financial reporting, organisational cash flow, and the mechanics of business decision-making. However, as I became more involved in building software applications that interact with financial data and payment systems, I began to see that many of the decisions embedded within these systems rely on broader economic principles. Questions related to market behaviour, incentives, risk, and resource allocation appeared repeatedly, and I realised I wanted to understand these concepts at a deeper analytical level.

Over the past two years, I have expanded my technical skills into software development, building full-stack applications using technologies such as Next.js, .NET Core, Stripe, Docker, and Azure. I have deployed production platforms with live users, including financial workflow tools I built independently. Working on these projects exposed me to real-world financial interactions and user behaviour, but it also highlighted the importance of economic reasoning behind pricing, adoption, and system design. For example, decisions about transaction costs, user incentives, and service scalability often involve economic trade-offs that go beyond technical implementation.

My background in Accounting introduced me to the financial side of organisations, while my software development experience exposed me to dynamic market interactions. Economics represents the bridge between these two perspectives. I am particularly interested in understanding how economic models explain market behaviour, how policy decisions influence financial systems, and how data-driven analysis can support better decision-making. I believe that formal graduate study in Economics will provide me with the analytical tools necessary to interpret these interactions more rigorously.

The Master's Degree in Economics at the University of Udine offers the academic environment I am seeking. The programme's focus on quantitative methods, economic theory, and applied analysis aligns with my goal of strengthening my analytical foundation. I am especially interested in developing skills in econometrics and data analysis, which will allow me to evaluate economic trends and support evidence-based decisions. The combination of theoretical coursework and applied learning within the programme is particularly appealing, as it matches my practical approach to learning.

I bring to this programme a multidisciplinary background that combines financial knowledge, technical development skills, and a strong motivation to deepen my understanding of economic systems. My experiences have shown me that effective financial and technological solutions depend on sound economic reasoning. Through the Master's Degree in Economics at the University of Udine, I aim to develop the analytical and theoretical foundation necessary to contribute meaningfully to this intersection.
